

Where Health Happens: Health Begins Where Coloradans Live, Learn, Work and Play

Colorado Health Report Card Data Spotlight

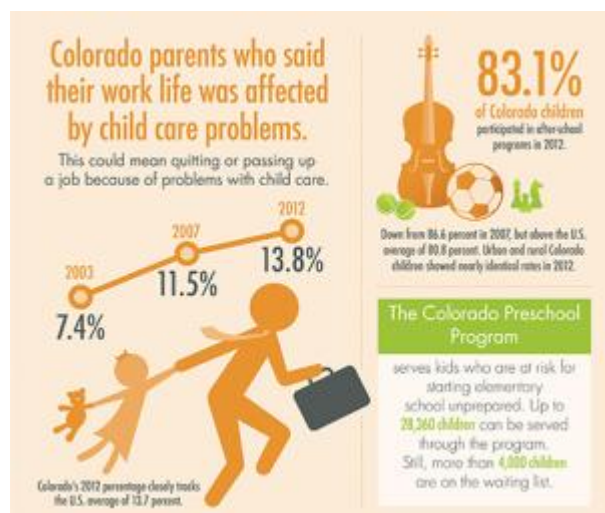

Publication Date

July, 2016

This Data Spotlight, [Where Health Happens: Health Begins Where Coloradans Live, Learn, Work and Play](#), explores nontraditional drivers of health including education and child care; financial security and safety; food access; housing; and transportation. It features stories from three Colorado communities facing disparities and taking action to improve the health and well-being of local residents, including two Denver neighborhoods and the city of Walsenburg.

Education and Child Care

Coloradans with more education report better health than their less-educated counterparts. Studies have even found that higher levels of education lead to longer lives, underscoring the importance of making education a priority from the get-go.

Financial Security and Safety

Studies show a strong link between living in low-income areas and higher rates of obesity and greater chances of disease. Residents of neighborhoods plagued by crime and violence also face higher health risks.

Food Access

A diet filled with fruits and vegetables is linked to lower obesity rates and better overall health outcomes. Yet, one of seven Coloradans, and one of five children, are unable to afford or access healthy, adequate meals.

Housing

Poor housing has been associated with an increased risk of chronic illness, inadequate nutrition — especially among children — and poor mental health. High housing costs force many low-income families to make difficult choices and trade-offs.

Transportation

How we get around affects our health and the health of those around us. Driving from A to B — rather than walking, cycling or taking public transportation — can result in less physical activity and more negative health consequences.

COLORADO HAS

728 drivers
per 1,000 residents.

This is 9 percent higher than the national average of 671 and higher than nearby states such as Utah (573), Wyoming (723) and New Mexico (698).

**Nine
of
Ten**

91 percent of Colorado's commuters drive to work — a little higher than the national average of 90 percent.

This number hasn't changed since 2009.

Biking to Work

Boulder County

has the highest percentage of all urban Colorado counties, with nearly 5 percent of workers hopping on their bikes.

In two Colorado counties, San Juan and Gunnison, over one of 10 commuters bike to work.

In 41 out of 64 Colorado counties, less than one percent of commuters bike to work.
